

4. STATISTICAL ANNEX

4.1 Production

4.1.1 Challenges in estimating the production of pure cocaine HCl

For many years, UNODC has estimated the potential production of cocaine for each producing country with the purpose of providing information on the global supply of cocaine. Potential production refers to the amount of cocaine that would be produced if all the leaves harvested from the area under coca cultivation in one year would be converted into 100% pure cocaine hydrochloride (HCl).¹ The reference to 'potential' production underscores the fact that the recovery of cocaine from the leaves may not be absolute (that is, 100% recovery). The term *laboratory efficiency* is therefore employed as a measure of how efficient a particular process is. Coca paste and cocaine base (intermediate products of the transformation process from leaves to cocaine HCl) can also be marketed and consumed. In addition, these intermediate products and leaves may be seized before they are processed into cocaine.

Traditionally, the production of cocaine HCl includes three steps. The first is the conversion of the coca leaf into coca paste; this is almost always done very close to the coca fields to cut down on the transport of the coca leaves. The second phase is the conversion of coca paste into cocaine base. The final stage is conversion of base to HCl. In recent years, this process has been cut into two stages, where leaves are converted directly to cocaine base.

In order to estimate the total potential production of pure cocaine HCl, the following elements need to be measured:

- Cultivation
- Quantity of leaves per ha per year (yield)
- Quantity of leaves needed to produce 1 kg of 100% pure cocaine HCl. This includes the following elements:
 - Alkaloid content of leaves
 - Laboratory efficiency (the percentage of alkaloid content that can be extracted in the laboratory process)

1 In Peru and the Plurinational State of Bolivia, a certain amount of coca leaves (leaves harvested from 12,000 ha of coca bush grown under law 1008 in Bolivia and 9,000 mt of coca leaves in Peru are estimated to be used for traditional purposes) is subtracted from the calculation of potential cocaine production.

Over the years, UNODC has undertaken studies in the three producing countries of the Plurinational State of Bolivia, Colombia and Peru.² Of the three components needed to estimate the potential production of cocaine HCl, UNODC regularly measures cultivation and yield,³ but does not undertake any study to measure alkaloid content and laboratory efficiency. For this last step, it relies on an external source, the US Drug Enforcement Administration (DEA). The DEA is the only organization that has undertaken scientific studies to measure the alkaloid content of the coca leaves and laboratory efficiency in the Andean countries. In Colombia, the estimation process followed by UNODC differs from that used in the other two Andean countries. Using farmers' interviews, UNODC can estimate the quantity of cocaine base produced from the leaves, although it cannot estimate its quality.⁴ Furthermore, it needs to estimate the average purity of the cocaine base produced and the conversion factor between cocaine base and cocaine HCl.

There is a certain level of uncertainty in each of the three stages necessary to estimate potential cocaine production.

Estimating cultivation

Since 1999-2002,⁵ UNODC's Illicit Crop Monitoring Programme (ICMP) has been monitoring coca cultivation in three Andean countries, the Plurinational State of Bolivia, Colombia and Peru. The cultivation estimates provide the situation at the end of each year. All coca surveys use remotely sensed images, that is, satellite images or aerial photographs,⁶ which is the best means

- 2 In each country, UNODC has project teams to conduct the surveys with assistance from a team of experts at UNODC headquarters in Vienna.
- 3 Yield studies are carried out by UNODC in Colombia (provinces are covered every five years on a rotating basis), the Plurinational State of Bolivia (Yungas of La Paz, 2005) and Peru (three major growing regions in 2003). No yield studies have been so far carried out by UNODC in Chapare/Bolivia where DEA yield estimates are used.
- 4 Through farmers' interviews, UNODC can only estimate the quantity of cocaine base produced, not its purity, since farmers are unaware of the level of purity of what they produce.
- 5 Since 1999 in Colombia, 2000 in Peru and 2002 in the Plurinational State of Bolivia. Since 2006, ICMP has been monitoring coca in Ecuador as well; however the extent of coca cultivation found there is negligible.
- 6 There are differences between satellite images, for example, in the

to undertake a systematic monitoring of the insecure and often inaccessible cultivation areas.

Every year, UNODC purchases satellite images from commercial image providers of all the areas where coca is grown. It is often a challenge to get images that are cloud-free, and therefore, the images are acquired over a period of several months, tasking the satellites or searching in recent archives. After acquiring suitable images, a team of experts systematically digitizes all the fields with coca bushes.⁷ Identification of the crops can be challenging. Satellite images are taken at a height of hundreds of kilometres above ground and do not give the same detailed image as a snapshot taken from the ground. On the other hand, satellite images contain more information than a normal photo, since the satellites have extra sensors to register infrared colours. Precisely these infrared colours help to distinguish vegetation types.⁸

In the classification process, additional geographical information is used to judge whether the fields appearing in the satellite image are really coca fields. For example, information on the places that were eradicated or sprayed is used as well as information from former surveys or contextual information, such as typical shapes, sizes and locations of coca fields. The interpretation of this diverse set of criteria is difficult to automate and is mostly done by human interpreters. All interpreters have extensive experience in working with satellite images and they are all familiar with the coca cultivation areas. The interpreters follow so-called interpretation keys to avoid systematic errors or differences between the interpreters.⁹

Monitoring with satellite images should always be accompanied by ground control. Ideally these controls are performed by field visits throughout the monitored area. Since access to the ground in coca growing regions is often dangerous and difficult, UNODC performs ground 'truthing' by overflights with helicopters or small aeroplanes. Moreover, the results of the satellite interpretations are subject to independent quality controls with detailed aerial photos.

■ ■ detail ('spatial resolution' or 'pixel size') of the images. The more detailed, the more expensive the images. However, the area to be monitored in Colombia is about 20 times larger than the areas in Peru or the Plurinational State of Bolivia, and therefore, the type of images is not the same in the three countries.

7 The full coverage of all the areas helps the governments to have local information on changes and target specific crop reduction programmes.

8 Coca is a bush and the leaves can be harvested throughout the year. Therefore, the crop stage can vary by field but also within a field. At the time a satellite image is taken, a field can contain different crops in different growing stages, which gives a different appearance in the satellite images.

9 The keys were developed with the assistance of the University of Natural Resources and Applied Life Sciences in Vienna.

Estimating yield

Coca leaf yield is affected by unpredictable factors such as weather and plant diseases, as well as by eradication activities. The effect of these factors varies not only from year to year and during the course of a year but also from one cultivating region to the other. Since 2004, UNODC, in cooperation with the respective governments, has undertaken coca leaf yield studies in many coca growing regions in the Plurinational State of Bolivia, Colombia and Peru. In the Plurinational State of Bolivia, a yield study was carried out in 2005 in the Yungas region, where the annual yield was estimated at 1.3 mt of sun-dried leaves per hectare. In Chapare, the other cultivating region, UNODC relies on DEA estimates, which report a yield of 2.7 mt/ha. In Peru, UNODC undertook a yield study in 2003, estimating the annual average yield to 2.2 mt/ha of sun-dried leaves. In Colombia, starting in 2004-2005, UNODC/SIMCI fields a yearly yield study which covers one or two regions on a rotating basis. The core element of these studies is the controlled harvest of mature coca fields.

The challenges related to the estimation of the annual yield relate to the difficulties of measuring the different harvests occurring in one year (four on average) and capturing the variation that the yield may have from one year to another. Ideally, the yield should be measured every year, in order to consider the climatic and environmental changes. However, yield studies need substantial resources, and not all areas under coca cultivation are accessible to field researchers for security reasons.

Latest coca yield estimates

Source: UNODC studies

Country, region	Year of study	Yield (mt/ha)
Bolivia, Yungas	2005	1.3 mt/ha sun-dried
Bolivia, Chapare	2006 (Source: DEA)	2.7 mt/ha sun-dried
Peru	2003	2.2 mt/ha sun-dried
Colombia, Meta-Guaviare	2008	5.1 mt/ha fresh leaf
Colombia, Sur de Bolívar	2007	5.7 mt/ha fresh leaf
Colombia, Putumayo-Caquetá	2008	4.1 mt/ha fresh leaf
Colombia, Orinoco	2005	7.1 mt/ha fresh leaf
Colombia, Pacífico	2009	3.8 mt/ha fresh leaf
Colombia, Catatumbo	2007	4.2 mt/ha fresh leaf
Colombia, Sierra Nevada	2007	2.9 mt/ha fresh leaf

Conversion factors from coca leaves to cocaine HCl

Source: DEA scientific studies

Country	Year of DEA study	Conversion factor ¹¹ (quantity of leaves needed to produce 1 kg of 100% pure cocaine HCl)
Plurinational State of Bolivia	1993	370 kg sun-dried (Chapare) 315 kg sun-dried (Yungas)
Plurinational State of Bolivia	2007-2008	256 kg sun-dried (Chapare) 244 kg sun-dried (Yungas)
Peru	1994	400 kg sun-dried
Peru	2005	220 kg sun-dried

Conversion factor from coca leaves to cocaine

Estimating the conversion factor from coca leaves to cocaine requires two steps: i) measuring the alkaloid content of the leaves, and ii) calculating the efficiency used by traffickers in the laboratory conversion process where cocaine base is converted into cocaine HCl. The alkaloid content of the leaves can be measured by analysing the chemical composition of a sample of coca leaves from the field. Studies have shown that it varies across geographical regions, but it does not significantly change over time. Alkaloid content is highest in Peru and the Plurinational State of Bolivia, where it is about 0.7%, and lowest in Colombia, where it is about 0.53%.¹⁰

Laboratory efficiency is more difficult to measure as there are different influencing factors: quality of the raw material and precursor chemicals used, the technical processing method employed, the size and sophistication of laboratories, and the skill and experience of local workers and chemists. Studies to measure the efficiency are carried out by trying to simulate the real environment where traffickers process cocaine in a laboratory. According to these studies, there are two main methods to produce cocaine: the solvent extraction method and the acid extraction method. The solvent method is thought to be the most efficient; however, traffickers are making the acid extraction method very efficient in Peru, where this method is most used.¹¹

The impact of conversion factors in the production estimates for the three Andean countries

According to the scientific studies conducted by the DEA, in the last decade, there has been an increase in the efficiency of the clandestine laboratories employed in the three Andean countries, which has resulted in different conversion factors from leaves to cocaine. These changes are mainly due to the higher percentage of traffickers using more efficient methods to extract the cocaine.

Until 2009, UNODC used the conversion factors obtained by the DEA in its previous round of studies dated 1994 in Peru and 1993 in the Plurinational State of Bolivia. In recent years, the DEA obtained new conversion factors which lead to a higher estimate of cocaine production (showing the need for a lower amount of leaves to produce pure cocaine).

In Colombia as well, more recent information obtained by UNODC shows that the conversion from cocaine base to cocaine HCl requires updated parameters:

Process used by UNODC to estimate 100% pure cocaine HCl from cocaine base of unknown purity

Source: DEA scientific studies

Cocaine base to cocaine HCl	1:0.9 (1 kg of base needed to produce 0.9 kg cocaine HCl)
Cocaine HCl	85% purity

Revised process to estimate pure cocaine HCl from cocaine base of unknown purity

Source: DEA scientific studies

Average purity of cocaine base	81%
Cocaine base to cocaine HCl	1:1 (1 kg of base needed to produce 1 kg cocaine HCl)

¹⁰ Although these numbers represent a national average, they can not be used to calculate cocaine production at the national level since they hide very diversified alkaloid contents measured in different regions of the same country.

¹¹ Taking into consideration the alkaloid content of leaves and the laboratory efficiency.

Impact of conversion factors on global estimates of potential cocaine HCl production (mt)*

* Assuming that all other parameters remain unchanged.

Applying the results of the more recent DEA studies has an effect on the level of cocaine production estimated for the three Andean countries, as shown in the graph. UNODC is currently analysing in more detail these new conversion factors.

4.1.2 Afghanistan

Fact sheet – Afghanistan Opium and Cannabis Surveys 2009¹

	2008	Change on 2008	2009
Net opium cultivation (after eradication) ²	157,000 ha (130,000-190,000 ha)	-22%	123,000 ha (102,000-137,000 ha)
Cannabis cultivation	No data		10,000-24,000 ha

Income from cannabis per ha (gross/net)	No data		US\$3,900 / 3,341
Income from wheat per ha (gross/net)	US\$1,600 / 1,280	-25%	US\$1,200 / 960

1 The information in this section comes from the Afghanistan Opium Survey 2009 (UNODC/Ministry of Counter Narcotics) and can also be found at <http://www.unodc.org/unodc/en/crop-monitoring/index.html>. Source unless otherwise indicated: National Monitoring System supported by UNODC.

2 Figures in brackets represent the upper and lower limits of the 90% (for 2008) and 95% (for 2009) confidence interval.

3 Poppy-free provinces are those which are estimated to have less than 100 ha of opium cultivation.

4 Garda is the local term used in Afghanistan for the powder obtained by threshing and sieving the harvested and dried cannabis plants. This process is repeated several times and results in different quality of garda (first, second, ...). Garda is further processed into hashish, which is the traded product.

5 Estimates are based on a population of 25.5 million and an average household size of 6.5 persons for 2009 (Afghan year 1387) and a population of 24.5 million for 2008 (Afghan year 1386). Source: Gov. of Afghanistan, Central Statistical Office.

6 In 2008, the fresh and dry opium prices at harvest time were based on farmers responses collected through the Annual Opium Survey. In 2009, prices at harvest time were derived from the opium price monitoring system and refer to the month when opium harvest actually took place in different regions of the country.

7 Nominal GDP estimates, without the drug economy. For 2008: US\$ 10.2 billion (Afghan fiscal year 2007/08), for 2009: US\$ 10.7 billion (Afghan fiscal year 2008/2009): Source: Gov. of Afghanistan, Central Statistical Office.

Potential manufacture of cocaine in Colombia⁴

Potential manufacture of cocaine in Colombia (mt), 1995-1998*

* Data sourced from US government estimates. UNODC did not have monitoring systems in place during the period 1995-1998.

Potential manufacture of cocaine in Colombia (mt), 1999-2003⁵

⁴ In past years, UNODC published a single graph with production data up to the latest year available emphasizing the break in series between 2003 and 2004. This year three graphs are published emphasizing the non-comparability of the data presented for three sets of years.

⁵ Over the period 1999-2003 UNODC monitored the coca cultivation in Colombia, but it did not carry out yield studies and therefore production figures comparable with the data after 2004 can not be calculated. Different figures for the years 1999-2003 can be calculated using different assumptions on the level of yield during these years. Utilizing UNODC cultivation data and a cocaine yield calculated from US estimates of coca cultivation and cocaine production produces the line labelled "Constructed with UNODC cultivation

and US yield". The line labelled "US Government estimate" simply reports the cocaine production figures published by the United States, which are based on their own cultivation and yield estimates for Colombia. The line labelled "Constructed with UNODC cultivation and UNODC 2005 yield" was calculated utilizing UNODC cultivation data and a cocaine yield calculated through a linear interpolation of the cocaine yield reported by the Government of Colombia for 2000 (5.8 kg/ha) and the cocaine yield estimated by UNODC for 2005 (8.2 kg/ha). Although these estimates are not comparable with UNODC estimates for 2004 and later, the decrease over the period 2001-2003 was additional to the further decrease over the period 2004-2009.

Potential manufacture of cocaine in Colombia (mt), 2004-2009

Data estimated on the basis of the cultivation census and the yield measurements regularly implemented by UNODC since 2004, as well as information on cocaine base purity and cocaine base to HCl conversion ratio from DEA.

4.1.5 Lao People's Democratic Republic

Fact sheet – Lao People's Democratic Republic Opium Survey 2009¹

	2008	Change on 2008	2009
Opium poppy cultivation	1,600 ha (600-2,700 ha)	+18.8%	1,900 ha (900-3,000 ha)
Average dry opium yield ²	6 kg/ha	-	6 kg/ha
Potential production of dry opium	9.6 mt (4.3-16.1 mt)	+18.8%	11.4 mt (5.4-18 mt)
Average retail/wholesale price of opium ³	US\$1,227/kg	+8%	US\$1,327
Eradication ⁴	575 ha	+13%	651 ha
Number of new opium addicts	4,906	-	n/a
Average drug prevalence rate (based on 7 northern provinces in 2008)	0.19%		n/a

Lao People's Democratic Republic, opium poppy cultivation* and eradication (ha), 2003-2009

* After eradication. Source: Cultivation: National monitoring system supported by UNODC; eradication: Government of Lao PDR

1 The information in this section comes from the report on Opium Poppy Cultivation in South-East Asia (UNODC/Governments of Lao PDR and Myanmar December 2009), and can also be found on the internet (<http://www.unodc.org/unodc/en/crop-monitoring/index.html>). Source unless otherwise indicated: National monitoring system supported by UNODC. Figures in brackets represent the upper and lower limits of the 90% confidence interval.

2 In the absence of a yield survey in 2008 and 2009, the yield per hectare for 2007 was used.

3 Source: LCDC, Provincial authorities survey. Due to the limited market for opium, a clear distinction between farm gate, wholesale and retail prices could not be established.

4 Source: LCDC. Since 2008, eradication campaigns were conducted during and after the survey.

4.1.6 Myanmar

Fact sheet – Myanmar Opium Survey 2009¹

	2008	Change on 2008	2009
Opium poppy cultivation in Myanmar	28,500 ha (17,900 to 37,000 ha)	+11%	31,700 ha (24,00 to 42,900 ha)
<i>Of which</i> in East Shan State	9,300 ha	+25%	11,900 ha
North Shan State	800 ha	+100%	1,600 ha
South Shan State	15,500 ha	+10%	16,500 ha
Elsewhere	3,200 ha	-16%	1,700 ha
Opium poppy cultivation in Shan State	25,300 ha	+19%	30,000 ha (24,000 to 40,000)
Average opium yield (weighted by area)	14.4 kg/ha	-27.8%	10.4 kg/ha
Potential production of dry opium in Myanmar (including the Shan State)	410 mt	-19.5%	330 mt (214 to 447)
Opium poppy eradication in Myanmar ²	4,820 ha	-15.2%	4,087 ha
Average farm-gate price of opium ³	US\$301/kg	+5%	US\$317/kg
Total potential farm-gate value of opium production ⁴	US\$123 million	-15%	US\$105 million (68 to 142)
Estimated number of households involved in opium poppy cultivation in Myanmar	168,000	+14%	192,000 (160,000 to 225,000)
Number of persons involved in opium poppy cultivation in Myanmar	840,000	+27%	1,066,000 (890,000 to 1,250,000)
Estimated number of households involved in opium poppy cultivation in the Shan State	148,900	19%	176,500 (141,200 to 235,300)
Average yearly household income in opium producing households (Shan State)	US\$687	+2%	US\$700
<i>Of which from opium sales</i>	US\$253	-37%	US\$160
Per capita income in opium producing households (Shan State)	US\$137	-9%	US\$125
Household average yearly income in non-opium poppy producing households (Shan State)	US\$721	+4%	US\$750
Per capita income in non-opium producing households (Shan State)	US\$144	-8%	US\$133
Addiction prevalence rate in Shan State and Kachin (population aged 15 and above)	1.1%	+36%	1.5%

1 The information in this section comes from the report on Opium Poppy Cultivation in South East Asia (UNODC/Governments of Lao PDR and Myanmar, December 2009), and can also be found on the internet (<http://www.unodc.org/unodc/en/crop-monitoring/index.html>). Figures in bracket refer to the upper and lower limits of the 95% confidence interval.

2 Source: CCDAC.

3 For 2008: yearly average price. For 2009: price at harvest time.

4 The farm-gate value should be calculated with the price of dry opium. However, the price of dry opium is difficult to establish in Myanmar because of the selling and storing practices of the farmers. The farm-gate value here is calculated with the price of fresh opium. This results in a lower estimate.

Myanmar, opium poppy cultivation (ha), 1995-2009

Myanmar, potential opium production (mt), 1995-2009

Opium poppy eradication reported by the Government of the Union of Myanmar (ha), 2002-2009

4.1.7 Peru

Fact sheet – Peru Coca Survey 2009¹

	2008	Change on 2008	2009
Coca cultivation	56,100 ha	+7%	59,900 ha
<i>Of which in</i>			
<i>Alto Huallaga</i>	17,800 ha	-2%	17,500 ha
<i>Apurímac-Ene</i>	16,700 ha	+5%	17,500 ha
<i>La Convención-Lares</i>	13,100 ha	+1%	13,200 ha
<i>Elsewhere</i>	8,500 ha	+38%	11,700 ha
Weighted average sun-dried coca leaf yield	2,200 kg/ha	-5%	2,100 kg/ha
Potential production of sun-dried coca leaf ²	122,300 mt	+5%	128,000 mt
Potential production of sun-dried coca leaf available for cocaine production	113,300 mt	+5%	119,000 mt
Potential production of cocaine HCl	302 mt		n.a.**
Average farm-gate price of sun-dried coca leaf	US\$3.4/kg	-6%	US\$3.2/kg
Average farm-gate price of sun-dried coca leaf (weighted) ³	US\$3.1/kg	-3%	US\$3.0/kg
Average farm-gate price of coca paste	US\$723/kg	+7%	US\$778/kg
Average price of cocaine HCl in coca cultivating regions	US\$940/kg	+9%	US\$1,021/kg
Potential farm-gate value of sun-dried coca leaf ⁴	US\$379 million	+1%	US\$384 million
Reported eradication of coca cultivation*	10,143 ha	-1%	10,025 ha
Reported seizure of sun-dried coca leaves*	2,132 mt	-52%	1,031 mt
Reported seizure of coca paste*	11,374 kg	-16%	9,914 kg
Reported seizure of cocaine HCl*	16,203 kg	-34%	10,744 kg
Reported destruction of coca laboratories ⁵ *	1,224	+1%	1,242
<i>Of which cocaine HCl processing laboratories</i>	19	+32%	25
Reported seizure of opium latex*	128 kg		n.a.

* As reported by the Government of Peru.

** Conversion rates from coca leaf to cocaine are currently being reviewed. This may lead to a revision of the 2008 figure (and of previous years). An estimate of the 2009 potential cocaine production in Peru was not available at the time of printing of this report.

- ■
- 1 The information in this section comes from the report on Coca Cultivation in Peru (UNODC/Government of Peru, June 2010), and can also be found on the Internet (<http://www.unodc.org/unodc/en/crop-monitoring/index.html>). Source unless otherwise indicated: National monitoring system supported by UNODC.
 - 2 Includes all coca leaf potentially produced. For the calculation of coca leaf available for cocaine production, 9,000 mt of sun-dried coca leaf were deducted from this figure, which, according to Government sources, is the amount used for traditional purposes.

- ■
- 3 The weighted average price takes into account that different amounts of coca leaf are sold in different regions at different price levels.
 - 4 Takes into account all coca leaf produced, irrespective of its use. For the calculation, the weighted average coca leaf price was used.
 - 5 Excluding coca leaf macerations pits.

Data primarily reflect (codes)

- a Geographically limited reporting (eg the Capital city)
- b Publicly funded treatment
- c NGO/ privately funded treatment
- d Inpatient/ hospitalization modality
- e Outpatient modality
- f Limited subpopulation (eg prison, youth, etc)
- g Opioid substitution treatment (eg methadone)
- h First-time treatment entrants (not returning clients)
- i Treatment admissions (not persons)

* Note that treatment definitions and reporting differ from country to country; totals which exceed 100% represent poly-drug use reporting.

** Figures may reflect number of persons or treatment episodes depending on Member State; figures exclude alcohol and nicotine.

*** The second year specified is for the number of people treated (last column).
